

I'm not robot!

Reviews & endorsements The book is truly outstanding. I'm passing it around to my colleagues to have them consider it for their courses. I loved all the problems worked out in great detail, how well written it is, and the very comprehensive nature of the presentation. It is a great book' Michael F. From a general point of view, signals are functions of one or several independent variables. There are two types of signals – discrete-time and continuous-time signals. Discrete-time signals are defined at the discrete moment of time and the mathematical function takes the discrete set of values. Continuous-time signals are characterised by independent variables that are continuous and define a continuous set of values. Usually the variable t indicates the continuous time signals, and the variable n indicates the discrete-time system. Also the independent variable is enclosed at parentheses for continuous-time signals and to the brackets for discrete-time systems. The feature of the discrete-time signals is that they are sampling continuous-time signals. The signals we are describing are obviously related to the features of the system as power and energy. The total energy of the continuous-time signal $x(t)$ over the interval $t \in [t_1, t_2]$ is $\int_{t_1}^{t_2} |x(t)|^2 dt$. Here $x(t)$ is the magnitude of the function $x(t)$. Here the brackets are describing the time-continuous interval $t_1 \leq t \leq t_2$. The parentheses (t_1, t_2) can be used for describing the time-continuous interval $t_1 < t < t_2$ and a
